

EARLY BIRD OFFER

CYDECTIN LA & MOXISURE LA 500ml Injection

With no capsules available this coming season, pressure will go on for the supply of long acting Moxidectin injection options.

We recommend you book your requirements early to guarantee supply.

Product recommendations for your in-lamb ewes.

1. Drench with Combination Sheep Oral plus administer a Long Acting (LA) Moxidectin injection.
2. Just use the LA Moxidectin injection.

Ideally if using just the LA injection, or option 1, you should drench the ewes again at 60 days with Combination Sheep Oral drench. This is because Moxidectin has a shorter claim against some worms as opposed to Barbers pole which has 92 days.

3. At 95 days drench with an effective exit drench, such as Triple Sheep to cut-off the tail of the Moxidectin, helping to prevent the development of resistance to it.

Both LA injections contain 20mg/mL Moxidectin.

Brand	Pack size	Price Incl GST	No Packs Required	Month required
